

Cross-season stability of conditional exposure slopes

Player slopes in successive seasons

MATCHED HITTERS

465

LATENT CORRELATION

-0.282 · 90% bootstrap range
[-0.999, 0.355]

RAW PEARSON CORRELATION

-0.081

2026 MSE CHANGE FROM INDIVIDUAL SLOPES

+0.005%
90% CI [+0.001, +0.008]%

Symmetric-log axes (linear within ± 0.1). Bootstrap quantiles are descriptive near correlation boundaries.
Positive MSE change means worse prediction. The test measures centered slope transport.
